IBIX R1®

The Ibox R1 Recovery System is designed to vacuum up, filter, and recycle garnet used in cleaning projects, saving money and the environment. 80% of safe material can be recovered* and reused, reducing abrasive purchases and waste disposal charges.

Garnet is nontoxic and contains no free silica, so recycling is not hazardous to operators or customers.

Recycling garnet reduces landfill, slows resource depletion, and encourages responsible disposal. It also reduces abrasive costs by 80%, and disposal costs by a similar amount.

The IBIX R1 uses a cyclone system designed to recover, separate, and recycle inert abrasives ready for reuse. The 1.6 kW - 3 kW turbine is available as a single-phase or three-phase option.

A special filter drawer captures debris and foreign objects large enough to create blockages ® in Ibox eco-blasters, which are often used to perform delicate surface cleaning projects using fine grades of garnet.
