Mobile Ecological Gum Removal. Independent hot water based systems .

IBIX has a special focus on low impact technologies to achieve benchmark results in the urban environment. Ibox use stable and non toxic media, including garnet (which is recycled) walnut shell (biodegradable) sodium bicarbonate (dissolves harmlessly in water) calcium carbonate (chalk) and other inert , recyclable, or biodegradable media.

Maintaining water and waste water systems with environmentally responsible solutions.

IBIX blasters are so gentle and accurate they are the first choice for the most sensitive urban restoration tasks - such as the Vatican, the Eiffel Tower, or the Louvre. IBIX even produces a portable laboratory for best analysis of building fabrics prior to taking any steps that might cause harm during restoration.

Removing rust stains, paint spills and other problems on building sites.

Portable blasters can access sites and heights not available to normal blast cleaners. IBIX has the advantage that the low pressures and tight controls available with Ibox blasters mean there is no longer need for major closures or pedestrian diversions. The use of non toxic media at low pressures is enhanced by the diminished levels of media usage when lower pressures can be used,

Cleaning street furniture, walls, motor vehicle marks and traffic grime.

Smaller compressor units use less energy, and IBX compressors are not only fuel efficient, but also low noise.

Removing graffiti without the need to repaint.

IBIX- not just a good citizen, but a problem solver in the city.

Cleaning and restoring heritage buildings (the Louvre)
